### Problem 1

1/1 point (graded)

I have a React component called “Parent” and want its “render” function to include a component called “Child,” and pass it a prop called “name” which comes from a property called “childName” in the Parent’s state. Which of the following is the correct implementation?

- ☒

```
render () {
  return (
    <Child name={this.state.childName} />
  );
}
```

 ✓
- ☐

```
render () {
  return (
    <Child name="this.state.childName" />
  );
}
```
- ☐

```
render () {
  return (
    <Child name=childName />
  );
}
```
- ☐

```
render () {
  return new Child( { name: this.state.childName } );
}
```

#### Answer

Correct:  
We can have the Parent’s “render” function include the Child using the JSX notation, and pass the prop by using `this.state.childName` and wrapping it in curly braces.
